

Wiem Boubakri

Full-Stack and DevOps Engineer · Magento, React, React Native, Google Cloud

Sousse, Tunisia · boubakri.ict@gmail.com · +216 52 370 702 · <https://github.com/wiembk> · <https://wiembk.github.io>

Summary

Full-stack and DevOps engineer who owns a production marketplace end to end: 1,900+ commits across five repositories since 2023, covering the Magento 2 backend, the React seller and store dashboards, the React Native shopper app, and the Google Cloud infrastructure they run on. Built the Wamia store system (multi-user stores, RBAC, KYC, JWT) and the payment, finance, and commission logic behind it. Runs production: incident root cause, capacity, CI quality gates, and the Magento 2.4.8 / PHP 8.3 upgrade. Now building the next platform in NestJS and Next.js on Terraform and Cloud Run, with MFA and scoped RBAC from day one.

Experience

Full-Stack and DevOps Engineer, Wamia

Sousse, Tunisia · October 2024 - Present

- September 2026 - Present. Founded the TypeScript platform that replaces the legacy stack: NestJS API, Next.js storefront, and admin on Cloud Run, all provisioned with Terraform (GCS state, staging and production roots, Cloud SQL, budgets, audit logs, EU backups). Security from the first deploy: email OTP, TOTP, and passkey MFA with step-up auth, scoped RBAC, JWT rotation, login throttling, non-root images, and a PR-provenance deploy gate. Staging refreshes from an anonymized production backup.
- 2026. Ran production Magento on Compute Engine (Nginx, Varnish, PHP-FPM, Redis, RabbitMQ, MariaDB). Root-caused and fixed site-wide 503 storms from a flapping Varnish probe, a PHP-FPM OOM crash loop, disk fill from unrotated container logs, and MariaDB crashes (documented forensics, upgraded 10.4.30 to 10.4.34). Replaced a hard 429 bot block with a Cloudflare Turnstile human check, tuned FPM pool sizing, and stood up a Prometheus, Alertmanager, and Grafana monitoring and observability stack with Blackbox and mysqld exporters and written alert rules. Brought a parallel Magento 2.4.8 / PHP 8.3 / OpenSearch staging stack and migrated the codebase to it.
- 2026. Added CI quality gates to the Magento repository in GitLab: PHPUnit integration and GraphQL API suites, security tests, and PHPStan with a managed baseline. Redesigned ClickToPay checkout as order-first with an atomic claim on pending payments, cart-drift protection, and status reconciliation, so no paid session is lost or double-placed.
- September 2025 - Present. Designed and built the Wamia store system: multi-user stores with RBAC, KYC document flows, and JWT auth, structured so a later upgrade is not a rewrite. Created the store dashboard. Modules cover catalog, orders, commissions, finance (balance, deposits, escrow, penalties, withdrawals, delay-penalty cron), promotions, discounts, reviews, refunds, CSV import/export, and analytics, exposed through an admin UI and GraphQL. Added a nightly Elasticsearch attribute reindex and a composite-score product ranking.
- 2025 - 2026. Shipped the React Native shopper app with Expo and EAS Build: search, cart and stock, coupons, ClickToPay, wishlist, OTP channels, orders, and returns. iOS to TestFlight then the App Store; Android to Google Play as an App Bundle.
- May 2025 - August 2025. Shipped Seller Pause in Magento and React, and Meta Catalog Sync from Magento to Meta. Wrote the migration plan off the legacy marketplace.
- October 2024 - May 2025. Created the React and TypeScript seller dashboard in French, English, and Arabic: products, inventory, orders, invoices with VAT, finance, store reviews, and analytics with a KPI guide. GitLab CI builds a Docker image and deploys it to Cloud Run against Magento GraphQL on Compute Engine.

Software Engineer and DevOps Engineer, OBG

January 2023 - October 2024

- September 2024. Seller inventory on Magento: stock-status editing, product filters, and a PDF of filtered invoices. Added the tag manager module.
- August 2024. Inventory list with pagination and translations, seller order status updates, cancel-processing, and order PDFs with the seller logo. Email to the seller when an order moves to processing.
- May 2024. Commission rules for seller products: percent tiers, two-decimal amounts, and special-price handling. Product dimensions and parent commission for variant products. Barcode assignment in the admin and on the storefront.
- February 2024. Seller product creation: stock from the quantity the seller sets, default catalog visibility, and required weight. Automatic import of enabled Magento products into Odoo, including fulfillment type and dimensions.

Key Achievements

- 1,929 commits across 5 repositories, November 2023 to September 2026, peaking at 244 commits in one month.

- Sole owner of three surfaces on one product: Magento backend and GraphQL, React dashboards, React Native app, and the release path for each.
- Production incidents closed with a documented root cause: Varnish probe 503s, PHP-FPM OOM, log disk fill, MariaDB crashes.

Projects

Infrastructure as Code and Magento Deployment

ENET'Com · 2023 · <https://github.com/wiembk/magento-IAC> · <https://github.com/wiembk/magento-ec2>

- Designed a high-availability AWS architecture in CloudFormation in eu-central-1 across two availability zones: VPC, public and private subnets, NAT, security groups, Application Load Balancer, Auto Scaling, Aurora MySQL, Elasticsearch, ElastiCache Redis, and S3.
- Automated Magento 2.4.3 installation with Bash on EC2. The script reads CloudFormation exports and connects the shop to Aurora, Elasticsearch, Redis, and the load balancer.
- Wrote a cost and performance reading of the design against projected traffic.

Education

Engineering Degree, Network and Cloud Infrastructure

ENET'Com, Sfax · 2020 - 2023

Preparatory Class, Mathematics and Physics

ESSTHS, Sousse · 2018 - 2020

Skills

Programming: PHP, TypeScript, JavaScript, Python, Bash, SQL

Frontend: React, Next.js, React Native, Expo, i18n (FR/EN/AR, RTL)

Backend: Magento 2, PHP, GraphQL, REST APIs, Node.js, NestJS, Odoo, JWT, RBAC, MFA (OTP, TOTP, passkeys)

Quality and CI/CD: PHPUnit, PHPStan, GraphQL API tests, security tests, e2e screenshots, GitLab CI/CD, GitHub Actions

DevOps: Linux (Debian, Ubuntu), Docker, Docker Compose, Nginx, Varnish, PHP-FPM tuning, Terraform, CloudFormation, Prometheus, Grafana, Alertmanager, SSL/TLS (Cloudflare, Let's Encrypt), DNS, SSH/SFTP, incident root cause

Cloud: Google Cloud Platform (GCP: Compute Engine, Cloud Run, Cloud SQL, Cloud Storage, Artifact Registry, IAM), AWS (VPC, EC2, RDS Aurora, S3, ALB, ElastiCache), Cloudflare (Turnstile, CSP)

Data: MySQL, MariaDB, PostgreSQL, Redis, Elasticsearch, OpenSearch, RabbitMQ

Payments and integrations: ClickToPay, Meta Catalog, WhatsApp notifications, WinSMS, App Store Connect, Google Play

Certifications

- AWS Cloud Practitioner Essentials
- DevOps on AWS Specialization
- Cloud Operations on AWS
- Azure Fundamentals
- Introduction to Programming Using Python
- Introduction to Git and GitHub
- Introduction to Network Automation
- Crash Course on Python
- IBM Full Stack Software Developer Professional Certificate (in progress)

Languages

English, C1. French, B1.
